(UNNY ) UNIV NEW YORK STATE.

Novel P-PII genes capable of regulating plant nitrogen assimilation, useful for transgenic plant production, and as probes for isolating additional genomic clones having P-PII gene promoters.

Claim 2; Fig 13; 35pp; English.

The present sequence encodes a nitrogen regulatory PII protein. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CGGCACGAGGCTACTGCGAAACTGGGCTTGCTCACTCCTCTTCTAATAACATCAAG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence encodes a nitrogen regulatory PII protein. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clawith the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TCTCACTTTAACACCGCGGTCAAGCGCGTAAGATATGCCCCCGTCGTTCCTGTGATTAAT

Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clawith the promoters of P-PII genes. P-PII promoters are light- and/or

transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                      115
                                                                                                                                                                                                                          126

The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

                            The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for protein.

The present sequence represents DNA encoding an A. baumannii
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antibacterial; fungicide; insecticide; polymorphism; genetic analysis; detection; food; gene expression; plant; animal; microorganism; toxin; antibiotic; biopesticide; virulence factor; disease model; plague;

                                                                                            The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences as sources of probes and primers for detecting the genome of P. lumiand related species; to study polymorphisms; for gene analysis and detection/amplification of the genes. Antibodies {Ab} raised again polypeptides encoded by the genes are used for detection/identificarry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in animals or microorganisms other than P. luminescens and are able response or sensitivity to toxins and antibiotics produced by P. luminescens. Cells transformed to express the genes are useful for the secons.

Also disclosed are the nucleic acid molecules encoding the proteins an antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABZ37706-ABZ42016 represent nucleic acid molecules of the invention

```
specifically claimed Neisseria meningitidis genomic DNA sequences;
AAA81260 to AAA81303 and AAB25620 to AAA815563 represent Neisseria DNA
sequences and their corresponding proteins; AAA81254 to AAA81259 and
AAA81304 to AAA81321 represent PCF primers used in the isolation of
Neisseria meningitidis DNA sequences; and AAA81322 to AAA81452 represent
Neisseria meningitidis MenB polymucleotide ORF sequences, which are all
sequences, protein sequences, and antibodies against them, can be used in
the manufacture of a composition. The composition can be used as a
medicament (or in the manufacture of a medicament) for treating,
preventing or diagnosing infection due to Neisserial bacteria. For
example, some of the identified proteins could be components of vaccines
against Meningococcus B; against all serotypes; and/or against all
coganism-specific probes. Attempts to make efficacious Meningococcus B
vaccines have failed mainly due to antigen tolerance. Multivalent
vaccines have also been tried but none have successfully overcome
that may be presumed targets for the immune system and which are not
variable variable or at least more conserved than other more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             13722
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   13898

T15252

CN Cr8852 lambdaZAPST Ricinus communis cDNA clone pcr8852 similar to nitrogen-regulatory protein, mRNA sequence.

N T15252

T15252.1 GI:14190796

EST.

Ricinus communis (castor bean)

SM Ricinus communis

Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots; rosids; eurosids I; Malpighiales; Euphorbiaceae; Acalyphoideae; Acalypheae; Ricinus.

E vandeLoo, F.J., Turner, S. and Somerville, C.

Expressed sequence tags from developing castor seeds

J. Bot. 60:1751-1760, 1982) endosperm plus embryo of immature castor fruits. CDNA was synthesized and cloned into lambdaZAPII accordito the instructions of the manufacturer (Stratagene): synthesis was primed from the poly(A) tail, and cloned directionally into XhoI (3') and EcoRI (5') sites. In cases, sequence data indicated that this directionality was reversed. Partial cDNA clones predominate. "

XhoI; Immature seeds, collected from pods ranging in age
from 11 to 19 days after pollination, were harvested from
greenhouse-grown plants. Seeds were removed and
separated from pod walls and were immediately frozen in
liquid nitrogen. Seeds throughout the age range were
pooled for mRNA extraction. cDNA was prepared from polyA+
enriched RNA. The cDNA was directionally ligated into
the Unizap XR vector from Stratagene and packaged using
Gigapack III Gold packaging extracts. Plasmids containing
cDNA inserts were excised from the recombinant lambda-Zap
phage using Ex-assist helper phage and propogated in
